

Data Integration Flow

Keen Enterprise LLC | WhatsApp & Bitrix24 Synchronization

Overview

This document outlines the seamless movement of data between **Gupshup** (WhatsApp Provider) and **Bitrix24** (CRM) managed by a custom application hosted on **Bluehost**.

Source: WhatsApp Message

- 1 A customer sends a message to the business WhatsApp number. Gupshup receives this message via Meta infrastructure.

Bridge: Gupshup Webhook

- 2 Gupshup triggers a POST request (Webhook) containing the message, sender's phone, and media links to the Keen Enterprise app hosted on Bluehost.

Processing: Keen Enterprise App

- 3 The app (webhook.php) validates the data, identifies the sender, and checks if a Lead exists in Bitrix24 using the phone number.

Destination: Bitrix24 CRM

4

The app calls the Bitrix24 REST API to create/update a Lead and delivers the message directly to the **Open Channel** chat for the agent to reply.

Key Data Mapping

Data Type	Gupshup Field	Bitrix24 Field
Sender Identity	from (Phone)	PHONE / LEAD TITLE
Message Content	text.body	MESSAGE_TEXT (Open Channel)
Attachments	image/video/file	FILES (Timeline/Chat)
Delivery Status	statuses	MESSAGE_STATUS (Delivered/Read)

Technical Environment

- **Hosting:** Bluehost (Managed by Keen Enterprise LLC)
- **Security:** All transfers use HTTPS/SSL encryption.
- **Automation:** Automatic Lead creation for new inquiries.
